

#### **EXPERIMENT - 1**

Student Name: Aman Ramola UID: 23BCS10001

**Branch:** CSE general **Section/Group:** KRG\_1-B

Semester: 5th Date of Performance: 22/07/2025

Subject Name: ADBMS Subject Code: 23CSP-333

1. AIM: Ques 1:- Author-Book Relationship Using Joins and Basic

SQL Operations. (EASY LEVEL)

1. Design two tables — one for storing author details and the other for book details.

- 2. Ensure a foreign key relationship from the book to its respective author.
- 3. Insert at least three records in each table.
- 4. Perform an INNER JOIN to link each book with its author using the common author ID.
- 5. Select the book title, author name, and author's country.
- 2. TOOLS USED:- MS SSMS & Microsoft SQL Server

# 3. SQL CODE:

CREATE TABLE

TBL\_AUTHOR( AUTHOR\_ID

INT PRIMARY KEY,

AUTHOR\_NAME

VARCHAR(30));

**CREATE TABLE** 

TBL\_BOOK(BOOK\_IDINT

PRIMARY KEY,

BOOK\_TITLE

VARCHAR(30), AUTHOR\_ID

INT.

FOREIGN KEY (AUTHOR\_ID) REFERENCES TBL\_AUTHOR(AUTHOR\_ID));

INSERT INTO TBL\_AUTHOR (AUTHOR\_ID, AUTHOR\_NAME)

VALUES (1, 'C.J. Date'), (2, 'Silberschatz'), (3, 'A. Tanenbaum');

#### INSERT INTO TBL\_BOOK (BOOK\_ID, BOOK\_TITLE, AUTHOR\_ID) VALUES

(101, 'Database Systems', 1),

(102, 'Operating Systems', 2),

(103, 'Computer Networks', 3),

(104, 'Advanced Databases', 1),

(105, 'Modern OS', 2);

SELECT \* FROM

TBL\_BOOK; SELECT \*

FROM TBL\_AUTHOR;

SELECT B.BOOK\_TITLE,

A.AUTHOR\_NAME FROM TBL\_BOOK AS

В

**INNER JOIN** 

TBL\_AUTHOR AS

A ON

B.AUTHOR\_ID = A.AUTHOR\_ID;

## 4. OUTPUT:

	BOOK_TITLE	AUTHOR_NAME
1	Database Systems	C.J. Date
2	Operating Systems	Silberschatz
3	Computer Networks	A. Tanenbaum
4	Advanced Databases	C.J. Date
5	Modern OS	Silberschatz

#### **5. Ques 2: -**Department-Course Subquery and Access Control. (MEDIUM LEVEL)

- 1. Design normalized tables for departments and the courses they offer, maintaining a foreign key relationship.
- 2. Insert five departments and at least ten courses across those departments.
- 3. Use a subquery to count the number of courses under each department.
- 4. Filter and retrieve only those departments that offer more than two courses.
- 5. Grant SELECT-only access on the courses table to a specific user.

## 6. SQL CODE:-

```
-- Step 1: Create Tables
  CREATE TABLE Departments (
  department_id INT PRIMARY
  KEY.
  department_name VARCHAR(100) NOT NULL
);
CREATE TABLE Courses (
  course_id INT PRIMARY
  KEY.
  course_name VARCHAR(100) NOT
  NULL, department_id INT,
  FOREIGN KEY (department_id) REFERENCES Departments(department_id)
);
-- Step 2: Insert Data into Departments
INSERT INTO Departments (department_id, department_name) VALUES
(1, 'Computer Science'),
(2, 'Mechanical Engineering'),
(3, 'Electrical Engineering'),
(4, 'Civil Engineering'),
(5, 'Mathematics');
-- Step 3: Insert Data into Courses
INSERT INTO Courses (course_id, course_name, department_id)
VALUES (101, 'Data Structures', 1),
(102, 'Operating Systems', 1),
(103, 'Machine Learning', 1),
(104, 'Thermodynamics', 2),
```

```
(105, 'Fluid Mechanics', 2),
(106, 'Circuits and Systems', 3),
(107, 'Control Systems', 3),
(108, 'Structural Analysis', 4),
(109, 'Linear Algebra', 5),
(110, 'Calculus', 5),
(111, 'Probability Theory', 5);
-- Step 4: Count Number of Courses per Department
SELECT
  department_name,
  (SELECT COUNT(*)
  FROM Courses c
  WHERE c.department_id = d.department_id) AS course_count
FROM Departments d;
-- Step 5: Filter Departments Offering More Than 2 Courses
SELECT
  department_name,
  (SELECT COUNT(*)
  FROM Courses c
  WHERE c.department_id = d.department_id) AS course_count
FROM Departments d
WHERE (SELECT COUNT(*)
   FROM Courses c
   WHERE c.department_id = d.department_id) > 2;
```

## 7. OUTPUT

	department_name	course_count
1	Computer Science	3
2	Mathematics	3
